

SQL VIEWS

ASSIGNMENT

ROUTE

ASSIGNMENT: DATABASE VIEWS

The goal of this assignment is to help you understand how database views work, how to create them, and how they are used for business reporting. You will practice creating views using simple joins, grouping, and aggregate functions.

Instructions

- Write one SQL CREATE VIEW statement per question.
- Name each view clearly based on what it represents.
- Do not modify the tables or data.
- Do not use subqueries unless required.
- Focus on correctness and readability.

Submission Requirements

Submit:

- A single .sql file containing all CREATE VIEW statements
- Views must run without errors
- Views must return meaningful results when queried

ASSIGNMENT: DATABASE VIEWS

Access the following [Database](#) then Find:

1. **Total revenue by customer showing customer name and total revenue**
2. **Customers with at least 3 orders showing customer name and order count**
3. **Average order value per customer showing customer name and average amount**
4. **Total revenue by product showing product name and total revenue**
5. **Total quantity sold by product showing product name and total quantity sold**
6. **Number of orders per day showing order date and order count**
7. **Total sales per day showing order date and daily sales amount**
8. **Total payments by payment method showing payment method and total collected**
9. **Total payments per day showing payment date and total payment amount**
10. **Shipment summary by carrier showing carrier name, shipment count, first shipping date, and last shipping date**

Bounce Problems:

1. **Orders with shipping status: order ID, customer name, order date, shipped_status (shipped / not_shipped)**
2. **Product price rank band: product name, price, price_band based on price (budget/standard/premium)**
